

# NON DANGER ZONE COMING SOON!

Discovery in St. Pauli South:

The researchers at the renowned "Gute-Allianzen-Institut" have been investigating this condition for years.

And now the sensation! At the beginning of the year, the researchers identified an anomaly in the danger spectrum.

The pointer on the danger detector trembled only slightly in one place. He didn't lash out like he always did everywhere.

„We call the phenomenon ‚non-danger-zone‘. It still appears to be very unstable, but there is hope that it will increase and maybe eventually become permanent.
